Orig Pub : Pub: Zdravookhr. Belorussii, 1956, No 11, 51-52

Abstract : The general clinical picture, activity of catalase and blood morphology of irradiated animals, subject to amital or novocaine anesthesia of the skin, of the back or belly, is the same as in irradiated control animals. In the development of radiation syndrome, at first there occurred changes in the white (reduction of leucocytes began with lymphocytic decrease) and then red bloodcells. The earlier and stronger the leuco-neutro-, lymphocyte-, monocyte-, erythro- and reticulocytopenia, and also the lowering of catalase activity occurred, the larger was the

TITLE: Investigation of the Extraction of the Phosphomolybdic Acid  
(Izucheniye ekstragirovaniya fosfornomolibdenovoy kisloty)

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Khimiya i khimicheskaya  
tekhnologiya, 1959, Vol 2, Nr 2, pp 157-160 (USSR)

ABSTRACT: The subject mentioned in the title is interesting for the colorimetric determination of small phosphorus quantities, as well as for the separation of phosphorus and silicon (Refs 1-3). The extraction is connected with the solubility of the substances in corresponding solvents; from this point of view, the acid mentioned in the title (PhMA) is very poorly investigated. The following problems are particularly important: The distribution coefficient  $K_{\text{distr.}} = C_{\text{org}} : C_{\text{wat}}$  must be equal to the ratio of the solubility values of the corresponding substance in the organic solvent and in water ( $C_{\text{org}}$  and  $C_{\text{wat}}$  representing the concentration of this substance in the organic solvent and in water, respectively, under various conditions of equilibrium between them). It is further known that PhMA with butanol-1 can be completely extracted in practice from the aqueous solution. Consequently, there must be a great difference between the PhMA-state in water and in

Card 1/3

SOV/153-2-2-2/31

Investigation of the Extraction of the Phosphomolybdic Acid

butanol. There are, however, few numerical data in publications on this point. At the beginning, the experiments concerning the PhMA-solubility in water and in butanol-1 are described. The values of its solubility were described. Subsequently, the extraction of PhMA with butanol-1 is dealt with. On the basis of the results obtained in samples of the aqueous and non-aqueous phases, the distribution coefficients (Fig 1) were computed. The results show a strong and rather peculiar dependence of the PhMA-distribution on its concentration: at an equilibrium concentration of the PhMA in the aqueous phase not higher than 0.3 m, a stratification is formed: the ratio of the PhMA-concentrations is, in both phases, near the solubility ratios in the corresponding solvents. The value of the distribution coefficient is slightly changed by a threefold dilution. A further dilution produces a very strong increase in the distribution coefficient (Fig 1, Curve 2). At the equilibrium concentration of 0.1-0.01 m, the PhMA-state is changed in one of the phases, most likely in the aqueous phase. By measuring the electric conductivity of the PhMA-solution in water and in butanol, it was ascertained that seemingly the molecular form of PhMA is mainly extracted. This circumstance may account for the reduced extractability of PhMA in

Card 2/3

SOV/153-2-2-2/31

Investigation of the Extraction of the Phosphomolybdic Acid

dilutions below 0.004 m. Here namely, in the aqueous phase, it passes, for the most part, from the molecular into the ionic form. It is much more difficult to explain the initial increase in the distribution coefficient at the concentration change of 0.1 - 0.01 m. Apparently, there is no other explanation than that of a PhMA-polymerization in concentrated solutions. In fact, particularly the monomeric PhMA-forms are soluble in butanol (Ref 5). On the basis of the above data, an extraction scheme of PhMA in water and in butanol is put forward. In the presence of nitric acid and sodium nitrate, the PhMA-distribution coefficient rises by about 350 times (Figs 2, 3). There are 3 figures and 5 references, 4 of which are Soviet.

TITLE:

On the new silico-niobium molybdenum complex

PERIODICAL:

Ukrainskiy khimicheskiy zhurnal, v. 28, no. 9, 1962, 1114 - 1115

TEXT:

The presence of a new compound, formed by a reaction between niobate and silicomolybdenic acid in acid medium, was determined at the Institut obshchey i neorganicheskoy khimii AN USSR (Institute of General and Inorganic Chemistry AS UkrSSR). Several facts proving the individuality of the observed silico-niobium molybdenum complex (SNMC) are presented in this paper. The most specific property of the new complex shows the effect of nitric acid on the extraction of the heteropolycomplexes - the new complex, the corresponding phosphoniobium-molybdenum, and silicomolybdenum complexes - by iso-amyl alcohol. The results of corresponding experiments demonstrate that SNMC is extracted less into the organic phase than the silicomolybdenum complex and considerably less than its analog, i.e. the phosphoniobium molybdenum complex. Besides an identification in this manner, the complex could thus be separated from these heteropolycomplexes.

Card 1/2

On the new silico-niobium molybdenum complex

S/073/62/028/009/010/011  
A057/A126

Another characteristic of SNMC is the slow development of its yellow colour at pH 4 - 5, accelerated by boiling, while binary silicomolybdenic acid is quickly formed already at room temperature. A solution of silicate and molybdate at a ratio  $[Si] = (1/24)[Mo] = 1 \cdot 10^{-2} M$  in absence and presence of niobate  $[Nb] = 1 \cdot 10^{-2} M$  was acidified with different quantities of nitric acid and boiled. In the presence of niobium the yellow colour of SNMC developed already at pH = 6.5, while formation of the binary silicomolybdenic acid occurs only at pH = 5.5. The analogous phosphorus complexes are formed at a much higher pH. There is 1 figure.

TITLE: Determination of niobium and titanium as triple complexes with phosphomolybdic acid

PERIODICAL: Zhurnal analiticheskoy khimii, v.18, no.2, 1963, 196-201

TEXT: Ti and Nb react with phosphomolybdic acid (PMA) with  $\text{MoO}_4:\text{PO}_4 = 2$  in an acid medium (pH 1) forming phosphotitanomolybdic and phosphoniobomolybdic complexes (PTMC and PNNC, respectively). The sensitivity of the reaction is  $5 \mu\text{g}$  Ti or  $10 \mu\text{g}$  Nb in 25 ml of solution. It has previously been shown that the stability of the three heteropolycomplexes increases in the order: PMA, PTMC, PNNC. The effect of various complex forming materials (oxalate, citrate, complexone III, fluoride, phosphate and molybdate) on the three complexes has been studied to find new methods of determining Ti and Nb, based on the different stability of the complexes. PMA, acidified by nitric acid to  $\text{CHNO}_3 = 2.8 \text{ N}$ , is destroyed ten times quicker than PTMC and fifty times quicker than PNNC. If small quantities of

Card 1/2

Determination of niobium ...

S/075/63/018/002/006/009  
E195/E436

molybdate are added, only PNMC and no PMA is formed. This makes possible the determination of Ni. Although of different stability, the three complexes are equally destroyed by oxalate, complexone II and citrate; fluoride destroys the heteropolycomplexes in the order: PMA, PTMC, PNMC. This factor can be used for determination of Ti and Nb in the form of heteropolycomplexes. It is possible to determine niobium in the presence of titanium on the basis of a more rapid destruction of the phosphotitanomolybdic complex with fluoride, followed by the extraction of the remaining phosphoniobomolybdic complex with butanol-1. Tantalum does not turn yellow with the phosphomolybdic reagent. A method has been suggested for the determination of niobium in the presence of tantalum. There are 9 figures.

ACCESSION NR: AP4019507

S/0075/64/019/003/0320/0324

AUTHOR: Shkaravskiy, Yu. F.

TITLE: Extraction of phosphotitanomolybdenum heteropolycomplex, conditions for extracting and concentrating titanium.

SOURCE: Zhurnal analiticheskoy khimii, v. 19, no. 3, 1964, 320-324

TOPIC TAGS: titanium, extraction, concentration, phosphotitanomolybdenum complex, color reagent, quantitative analysis, colorimetric determination

ABSTRACT: In order to provide systematic data on the extraction of phosphotitanomolybdenum complex (PTMC), its distribution between 0.5 N nitric acid and several organic solvents (n-butanol, n-amyl alcohol, isoamyl alcohol, cyclohexanol, ethyl acetate, n-butyl acetate, ethylacetoacetate, methylbutylketone, cyclohexanone) was studied. With excess molybdate in the solution (in PTMC the P:Ti:Mo concentration is 1:1:12) the equilibrium is shifted in the direction of PTMC formation. Almost complete separation of titanium is effected with 0.02-0.04 M molybdate (fig. 1). The extraction of Ti as PTMC is applicable to the separation of Ti from elements which interfere with its pigmentation (Cr III, Cu II, Ni II, Co II,

Card 1/5

ACCESSION NR: AP4019507

Mn II,  $\text{MnO}_4^-$ ); to the separation of Ti from elements which react with reagents for Ti (Fe III, Al III, Pb II, Ta V, Hf IV); and to the concentration of Ti from dilute solutions. The effect of the time and the temperature of the reaction on the formation of the phosphomolybdate reagent is shown in fig. 2; the effect of acidity is shown in fig. 3. It is possible to separate PTMC and a phosphomolybdenum complex (PMC) by means of n-butyl acetate. With a 0.5 N acid concentration, 99.6% of PMC goes into the organic phase while 97% of the PTMC remains in the aqueous phase. The best extractant for PTMC is a mixture of 1-pentanol and cyclohexanol in a 2:1 volume ratio. Using 6 ml of this mixture it is possible, by a one-, two-, and three-fold extraction, to extract 82, 93, and 99% of titanium from 250 ml of a 1 N acid solution. By adding 6 ml of chloroform to the extract in the presence of 0.1 N  $\text{H}_2\text{SO}_4$ , titanium can be quantitatively stripped into the aqueous phase. The sensitivity of Ti determination is 0.01 microgram/ml when the optical density is measured at 313 millimicrons. Orig. art. has: 2 tables and 6 figures.

TITLE: A new hafnium-molybdenum phosphate heteropolycomplex

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 30, no. 11, 1964, 1170

TOPIC TAGS: hafnium molybdenum phosphate complex, synthesis, identification

ABSTRACT: Hf(IV) reacted with molybdenum phosphate to form a new compound, a hafnium-molybdenum phosphate complex (I) which was less stable than its Ti or Zr analogs. Although I could not be isolated as a solid, its existence was shown by the "calibration graph" method described earlier by the author (UKr. khim. Zh. 30, 241 (1964)). Butanol-chloroform (1:3 by volume) completely extracted molybdenum phosphate from a 1N acid solution, while the ternary complex remained in the aqueous phase. Hence the optical density of the latter, after extraction, was proportional to the amount of I in the system. The linear relationship between the optical density and the phosphate and hafnium concentrations

Card 1/2

TITLE: Use of phosphomolybdates of basic dyes in the extractive-photometric determination of phosphorus 15 27

SOURCE: Zhurnal analiticheskoy khimii, v. 21, no. 2, 1966, 196-199

TOPIC TAGS: photometric analysis, phosphorus, phosphorus compound, molybdenum compound, dye chemical

ABSTRACT: The interaction of the phosphomolybdic complex (PMC) of phosphorus with basic dyes (BD) and the possible use of the latter for the extractive-photometric determination of phosphorus were investigated. In acid media, PMC forms colored precipitates with the following BD: crystal violet, methyl violet, basic brilliant green, malachite green, auramine, iodine green, rhodamine 6G, neutral red, safranine, toluidine blue. A study of the extraction of PMC-BD compounds by eighteen

UDC: 543.70 Z

Card 1/2

L 23143-66

ACC NR: AP6006941

organic solvents of various categories showed alcohols and ketones to be the best extracting agents. In determining phosphorus with BD, it is necessary to separate excess molybdate from PMC; the extract can be separated completely from the molybdate by washing twice with nitric acid at pH 1.5. Shaking with an HCl solution of potassium permanganate completely decolorizes the free triphenylmethane dyes, while the PMC-BD compound is not affected. An extractive-photometric method was developed for determining phosphorus by means of iodine green (sensitivity, 0.03  $\mu\text{g}$  phosphorus per ml) and crystal violet (sensitivity, 0.01  $\mu\text{g}$  phosphorus per ml). Moscow, 1962. Energomashinostroyeniye. 72-84

TEXT: Tests with an instrument, consisting of U-tube liquid  
manometers attached to the rotating shaft of a turbine model and  
connected directly to moving points of the engine, are described.  
Relations between parameters of the instrument and working condi-  
tions are determined. These relations are checked by experiment.  
Maximum inaccuracy of the instrument is 3% for a pressure differen-  
tial of 100 mm water column. It can be used up to speeds of 2500  
RPM. There are 5 figures and 1 table.

TITLE: Static-head tube for 3-dimensional stream

SOURCE: Izmeritel'naya tekhnika, no. 9, 1963, 55-56

TOPIC TAGS: static head, static-head tube, 3-dimensional stream

ABSTRACT: For measuring static heads in the paths of turbine models, etc., where the 3-dimensional stream is complicated, a new static-head tube was designed and tested. A modification of the Pitot tube, the new 1-mm-diameter swan-neck-shaped tube has a ball-shaped inlet. Test results reported: (1) Inlet port shape has but little effect on the sensitivity to oblique flow; port size has an appreciable effect; (2) With ball diameter 4 mm or less, the sensitivity to oblique flow increases; (3) Shorter tubes have higher sensitivity to oblique flow; optimum dimensions are given in the article. Orig. art. has: 2 figures and

SOURCE: Leningrad. Politekhmicheskii institut. Trudy, no. 247, 1965. Turbomashiny (Turbomachines), 86-93

TOPIC TAGS: compressor, centrifugal compressor, jet engine, turbojet engine

ABSTRACT: In designing centrifugal-compressor<sup>23</sup> inlets, it is desirable to select a geometry in which losses are minimal and the flow field is uniform. The calculation of inlet geometry, however, presents several difficulties, since it involves flow deflection from the radial to the axial direction and the effect on flow structure of the wake caused by the shaft.<sup>10</sup> At the Leningrad Polytechnic Institute im. M. I. Kalinin, the flow of an inviscid incompressible fluid was studied by an electro-hydrodynamic-analog method using a wooden model impregnated with paraffin, copper plate electrodes, graphite probes, and diluted H<sub>2</sub>SO<sub>4</sub> as an electrolyte for determining the flow field. The results showed that the velocity field was highly nonuniform so that an inlet designed according to present design recommendations is inadequate. Further experiments were made with an annular inlet having the form of a helical chamber. From the total and static pressure measure-

TITLE: Results of an investigation of impellers in centrifugal compressors

SOURCE: Leningrad. Nauchno-issledovatel'skiy i konstruktorskiy institut khimicheskogo mashinostroyeniya. Tsentrobezhnyye kompressornyye mashiny (Centrifugal compressors). Moscow, Izd-vo Mashinostroyeniye, 1966, 154-166

TOPIC TAGS: centrifugal compressor, compressor blade, aerodynamic characteristic

ABSTRACT: The authors review the results of experimental and theoretical studies on improving the aerodynamic characteristics of impellers in centrifugal compressors. It is shown that impellers should be designed with a linear change in the cross sectional area with respect to channel length to improve flow characteristics. The number of blades should be selected on the basis of the optimum apex angle for the channels between blades. Experimental investigation of a large number of single-stage impellers with exit angles of 20, 49 and 90° showed that optimum impellers from the standpoint of maximum efficiency have 8-12, 16-18 and 28 or more blades respectively. However, stability is reduced with an increase in the number of blades so that two-

Card 1/2

L 45973-66

ACC NR: AT6026436

stage cascades are preferable for high-efficiency impellers with a large number of blades. Recommendations are made for optimizing the operation parameters of various types of centrifugal compressors on the basis of recent experimental research. Orig. art. has: 6 figures.

TITLE: Investigation of centrifugal compressor inlet ducts

SOURCE: Energomashinostroyeniye, no. 9, 1966, 26-29

TOPIC TAGS: ~~centrifugal~~ compressor inlet, compressor performance, inlet duct, centrifugal compressor, *compressor design*

ABSTRACT: Available design recommendations do not ensure the calculation of aerodynamically ideal inlet ducts for centrifugal compressors. The final duct contour is selected only after testing and modifications of models. Since the development of calculation methods for compressor inlet ducts is quite difficult, the Leningrad Polytechnic Institute (LPI) has conducted systematic experimental investigations of a series of centrifugal compressor inlet ducts. The geometry of tested ducts is shown in Fig. 1. The object of the investigations was to determine the effect of the geometric parameter  $K_F$  (where  $K_F = F_K/F_0$ ,  $F_K$  = cross sectional area of the cylindrical portion of the inlet and  $F_0$  = exit

cross sectional area of the inlet) on inlet duct losses. Tests were conducted in the range  $K_F = 1.15-2.83$  at a constant value of relative radius  $R = R/a$  and three values of  $\bar{r} = r/a$  ( $\bar{r} = 0.1875, 0.375$ , and  $0.625$ ). The obtained results show that an increase in  $K_F$  improves the flow characteristics in curvilinear ducts and reduces possibilities of flow separation on a surface of radius  $\bar{r}$ . The maximum reduction in the drag coefficient  $\xi_d$  was found to be at  $K_F \approx 2.0$ . Based on experimental data a calculation method was proposed which improves the efficiency of a compressor stage by 2—3%. The effect of the inlet duct on compressor stage characteristics is shown in Fig. 2. Orig. art. has: 6 figures and 5 formulas.

On the problem of deoxidizing steel with aluminum

S/137/61/000/012/001/149  
A006/A101

the interaction of Al with Fe oxides of the active layer of the furnace lining. Within the first 6 - 7 minutes of holding the metal, the total O content is reduced to minimum values; during longer holding it does not change or increases slightly; this occurs on account of levelling the rate of O supply and elimination from the metal. Establishing the constancy of the total O content in the metal at this moment does not correspond to an equilibrium state, since the Al concentration varies continuously. The equilibrium state begins after more than 15 minutes. The equilibrium constant of the deoxidation reaction of Fe with aluminum in a magnesite crucible is estimated to be  $1 \cdot 10^{-11}$  -  $0.5 \cdot 10^{-11}$ .

TITLE:

Main Unfavorable Factors of Labor of Fettlers and  
the Ways of Improving Their Work Conditions

PERIODICAL:

Liteynoye proizvodstvo, 1959, Nr 9, pp 19-21 (USSR)

ABSTRACT:

During the last years, the Institute of Hygiene AMS USSR had on frequent occasions to deal with professional illnesses spread among the fettlers working in machine-building plants. To determine the causes of these illnesses, the working conditions of 150 fettlers in two plants were investigated. At these plants, just as it is in other plants producing machine parts, all castings undergo a final cleaning and finishing by means of pneumatic hammers weighing from 4.5 to 6 kg and making from 1500 to 2500 strokes a minute. At operating these hammers, the fettler is exposed to harmful action of shaking and vibration. As is well known, vibration is determined by its oscillation frequency, amplitude, acceleration speed, and energy. On the basis of numerous experimental and clinical materials, the Ministry of Public Health has, in 1955, worked out tem-

Card 1/2

SOV/128-59-9-6/25

Main Unfavorable Factors of Labor of Fettleers and the Ways of Improving Their Work Conditions

porary rules regularizing the value of vibration parameters (combination of frequencies and amplitudes) that would be innocuous for the operators of pneumatic tools. Besides vibrations affecting the human body, there are some other factors that exert a negative influence on physical conditions of workers in foundries; to these factors belong: noise, physical strain, and the presence of dust in the air. To remedy some of these conditions, the author recommends: 1) to diminish the noise - application of wooden frames with rubber linings to be used during the process of cleaning of castings; 2) mechanization and automation of fettling and finishing; 3) thorough preliminary cleaning of castings by means of sand-blasting machines, before putting them to the fettling. There are 1 graph and 3 tables.

TOPIC TAGS: defect indicator, ferromagnetic material

ABSTRACT: This Author Certificate presents a device for continuous contactless detection of defects in cylindrical ferromagnetic products, based on the method of eddy currents. The device contains a high frequency generator, a power amplifier amplifying the high frequency voltage from the generator, a transducer supplied from this amplifier, an amplifier for amplifying the signal obtained from the transducer, an amplitude detector detecting the amplified signal from the transducer and an indicator recording the voltage change at the output of the amplitude detector. To increase the sensitivity and exposure of defects in background noise caused by changes of the magnetic permeability and conductivity in the controlled product, a slave magnetic system is introduced in the device. This controls the magnetization of the controlled product. The system contains an amplifier-limiter
